

Instructions

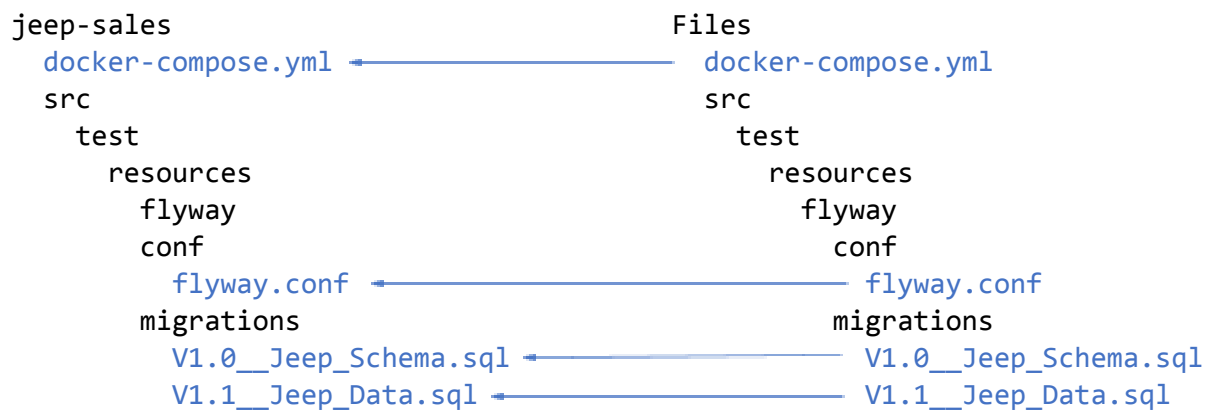

Read this first

Do these steps when instructed to in the homework.

- Week 1 homework: follow the instructions in "Files" section and the "Entities" sections when prompted by the homework.
- Week 4 homework: follow the instructions in the "Source" section when prompted in the homework.

Files

Copy all files in the "Files" folder to the corresponding locations in your Spring Boot project. For example: assume that your project directory is named "jeep-sales". Copy all files as shown:

Video #2 tells you to load the database schema (create table statements) and data into dBeaver after creating a connection. The schema file is found in <project>/src/test/resources/flyway/migrations in file [V1.0__Jeep_Schema.sql](#) and the data is in the same directory, in file [V1.1__Jeep_Data.sql](#). Use these files to create tables in the database and populate them with data.

Entities

Copy all files in the Entities folder into the `com.promineotech.jeep.entities` package.

Source

Copy all source code in the "Source" directory *into* the files of the same name in your project. For example, if you have a package in `src/main/java` named `jeep.sales`¹ and a sub-package named "dao" with a Java file named `DefaultJeepOrderDao.java`, open the corresponding file in the Source folder and copy the source into `DefaultJeepOrderDao.java` as shown:

¹ Note that the video named the base package `com.promineotech`. Whatever you named the package, find the file with the matching name and copy the code from the file with the same name in the Sources folder.

```
main
  java
    jeep
      sales
        dao
          DefaultJeepOrderDao.java
```
